

Is that new network infrastructure design project leaving you dazed and confused?

It's tough enough putting together a 5 year business plan, let alone the infrastructure design to support it. New technology will invariably scream for increased bandwidth and the processing power to support it. From Wide Area Networks (WAN) to VM-based server environments, VOIP telephone systems, to back-up and disaster recovery systems, we'll determine what you'll need and when you'll need it.

Infrastructure upgrades don't have to leave you scratching your head.

Planning:

Following a thorough site assessment, including interviews with key business stakeholders, we'll outline a hardware and software plan that makes sense. And since we don't represent a particular technology vendor, we're free to recommend the best solution for an individual organization.

Deployment:

Using our technology and financing leverage, we'll recommend hardware for lease or purchase, negotiate optimal software licensing and broadband connections, and then configure systems accordingly.

Testing:

After on-site installation, VertitechIT engineers will confirm full system functionality, utilizing test servers if necessary. A formal migration schedule will be determined to minimize operational impact.

Migration:

Once installed, operational documents will be delivered providing all technical and operational data for maintenance, upgrade, and troubleshooting.
