

When was the last time you put the spotlight on your telecom expenses?

Large businesses and healthcare organizations can process more than 100 telecom bills every month and many of those invoices are for services that aren't even being used. In fact, it's not uncommon for phone bills to contain billing errors that go unnoticed for years. Our Telephone Expense Management System (TEMS) is designed to examine where an organization is spending its telecom dollars, and show how it can put in place a methodology for monitoring monthly expenses going forward.

We'll flip the switch and save you at least 20% in the process!

Expense Auditing:

It starts by understanding what you have and what you're being charged. We'll examine a year's worth of billing statements and develop an accurate inventory of wireless and wireline devices. Audits include a performance and capacity review as well as a look at "Move-Add-Change" charges.

Sourcing:

It's critical to define what an organization actually needs, identify a list of providers that can meet those needs by benchmarking current contract terms and pricing, and developing a request for proposal that defines those requirements in detail. The sourcing process also includes negotiating with current vendors for credits and error resolution (renegotiating the contracts if necessary).

Ongoing Expense Management:

After the house is in order and savings are realized, the ongoing monthly expense management system reports on budgeting and troubleshooting, and provides a snapshot of expense and usage related trends.

Results:

An ongoing TEMS effort will result in a dramatic reduction in monthly telecom expenses, an up to date inventory of every network element (computers, cellphones, wireless devices, circuits, servers, etc.), and a thorough understanding of true network costs.
