

Having information at your fingertips can often be very revealing.

In today's EHR-driven world of healthcare, doctors and nurses want access to patient information wherever they are, whenever they want it, and on whatever device they happen to be using. Virtualized systems are critical to success and VertitechIT can combine leading manufacturer technologies and the "secret sauce" to make it work.

Virtualized systems are just what the doctor ordered.

Access:

The geographic distribution of clinical operations and new client devices like tablets and smart phones are bringing an end to the use of PCs in healthcare. Physical desktops don't provide the mobile, supportable access clinicians need to consistently use Epic, Cerner, McKesson, and other EHR solutions. We've successfully implemented thousands of virtualized seats at leading hospitals nationwide.

Personalization:

Doctors and nurses demand a highly personalized desktop experience. New integrated capabilities like dictation, unified communications, and real-time devices have eroded the initial gains offered by simple application streaming and shared terminal server sessions. We bring together a host of solutions to give clinicians the look and feel they want.

Compliance:

EHR, along with many of its interlinked systems, must be kept current with updates applied promptly to stay in compliance. Virtual desktops hosted on data center servers provide greater control, availability, and manageability than distributed PCs while insuring there is no data saved on endpoint devices that can be compromised or stolen.
