

Understanding the Cloud Conundrum

**Challenge:**

A west coast healthcare system is looking to embrace the public cloud and needs an independent and unbiased review of competing software-defined methodologies, a process for testing, evaluating, and implementing proposed solutions, and a roadmap for driving cultural and institutional change.

“We know we’re moving to the cloud but the road to get there is crowded with vendor claims that are often difficult to navigate.”

– Health System Associate CIO

Solution:

A three-month assessment results in a unified, network-wide objective for both private and public cloud implementation. The VertitechIT team identifies existing project deficiencies that require remediation and proposes solutions, providing a plan that increases the scalability, redundancy, and resiliency of systems and processes, making future expansion easier. Considerable focus is placed on breaking down the “we’ve always done it that way” barriers to technical innovation and providing the insights leading to a true department-wide cultural transformation.

Approach:

Major software companies are joining forces with hardware manufacturers to put hyper-convergence in a box, combining networking, storage, and compute solutions in a turn-key product. VertitechIT pioneered hyper-convergence for healthcare and through its proprietary TransformIT™ process, illuminates the relationships between technologies in a vendor agnostic fashion, demonstrating why each new platform technology must have common, software-defined methodologies that guarantee inter-operation.
